MISHMERET

The Autonomous Operations Brain for Care Beyond Hospital Walls

AI that runs the monitoring operations — the brain, not the box

Shimi Network · VentureHack 4 · i4Valley + GMC Playground

The Problem: Everyone Built the Box. Nobody Runs It.

- **Billions went into sensors and dashboards — RPM is a $110B market by 2033.**
  But a dashboard does not act. Someone must watch it 24/7.

- **At 3 AM, nobody is looking.**
  ICU: 942 alarms/day per nurse, one every 90 seconds — most non-actionable. At home: no nurse at all.

- **Operations still run on phone, WhatsApp and spreadsheets.**
  Dying batteries, missed readings, uncoordinated visits, wasted dispatch costs.

Sources: ScholarWorks ICU study · PMC alarm-fatigue review · Grand View Research

The Solution: An Autonomous Operations Layer

SENSE
Ingests events from ANY existing device or syste

TRIAGE
Suppresses non-actionable noise, ranks severity,

ACT
Contacts the patient, schedules the nurse, dispatches

VERIFY
Every action is checked against its real outcome

LEDGER
Immutable log of action, cost and result — audit, learning, and per-action billing

Clinical decisions always stay with humans. We run the operations — never the medicine.

Why This Is Real AI — Not a Chatbot

- **Event-driven, not prompt-driven.**
  No user asks anything. A stream of events is decided on autonomously, 24/7. Chat is one output channel, not th
- **Hierarchical multi-agent decision architecture.**
  Sense, triage, act and verify are separate components with distinct policies, permissions and accountability.
- **Deterministic policy engine over probabilistic reasoning.**
  Falsifiability-first: every action has a declared pass/fail threshold before it runs.
- **Outcome-based learning loop.**
  Every action is scored against its result — the triage engine improves from closed loops.

Proven in Production — Today

- **A live IoT device is already monitored autonomously.**
  Gate device with battery telemetry; alerting and heartbeat handling are automated.
- **Worker fleets run with heartbeats and fallback chains.**
  Local to cloud escalation: no work is ever stuck because one machine is off.
- **Autonomous routing on live business lines.**
  Real-time lead intake and response on WhatsApp business channels, multi-tenant by phone identity.
- **Agorot-precise financial ledger with idempotency.**
  Every action and shekel logged, duplicate-safe, auditable.
- **Hundreds of documented autonomous actions.**
  Openly auditable — months of real, working autonomy.

One Brain, Many Industries — 7 of 8 VentureHack Domains

Remote Monitoring (7)	Hospital-at-home, chronic care — first target
Prediction & Prevention (8)	Battery death, adherence drop, device failure — caught early
Hospital Operations (5)	Equipment logistics, workforce coordination
Production (2) · Supply Chain (3) · Energy (4)	Predictive maintenance, dispatch, site monitoring — same engine
Imaging & Detection (6)	Alert triage for diagnostic imaging pipelines

Domain-agnostic architecture: events in, policies applied, actions out.

Market

- **Remote Patient Monitoring systems: $110.7B by 2033 (20% CAGR).**
  Grand View Research. Alternative estimates $87B-$661B — huge in every scenario.

- **US home healthcare: $61.5B (2026) to $122.9B (2035).**
  Towards Healthcare. Acute Care at Home: $6.1B to $21.5B by 2034 (Inkwood).

- **Entry point: Israeli hospital-at-home programs.**
  GMC Playground: a live hospital (650K patients, Western Galilee) to build and test in.

- **Business model: platform subscription + per-closed-action billing.**
  The immutable ledger makes every autonomous action measurable and billable.

Exact Fit to the Official Criteria

Significant problem & pain

Nobody watches the screen at 3 AM; coordinators drown in phone+Excel

Solution generalizability

Domain-agnostic brain — proven across 4+ live environments already

Low integration complexity

Webhooks + existing channels. No hardware, no vendor replacement, no device regulatory path

Market potential

RPM $110.7B by 2033; clear cross-industry demand

What We Can Show on Day One

- **A live autonomous operations loop.**
  Real device telemetry to autonomous triage to action to verified outcome — in front of the judges.

- **Real documentation of months of autonomy.**
  Audit trail of autonomous decisions across devices, fleets, lines and funds.

- **A clear path into GMC Playground.**
  First pilot: the operational layer for hospital-at-home — device uptime, adherence, dispatch.

- **A team that builds fast and verifies everything.**
  Multi-agent protocol, policy engine, ledger, messaging rails — all built in-house.

Shimi Network

An autonomous multi-agent network, built and verified in production

Idea & architecture: Shimi Pituch (Development), Shimi Network
